

Raising vs. Control

Or don't judge a book by its cover

Some surprising parallels

- Jean is likely to leave
 - Jean is reluctant to leave
- Raising Control*
- Jean wants Brian to leave
 - Jean persuaded Brian to leave
- Raising Control*

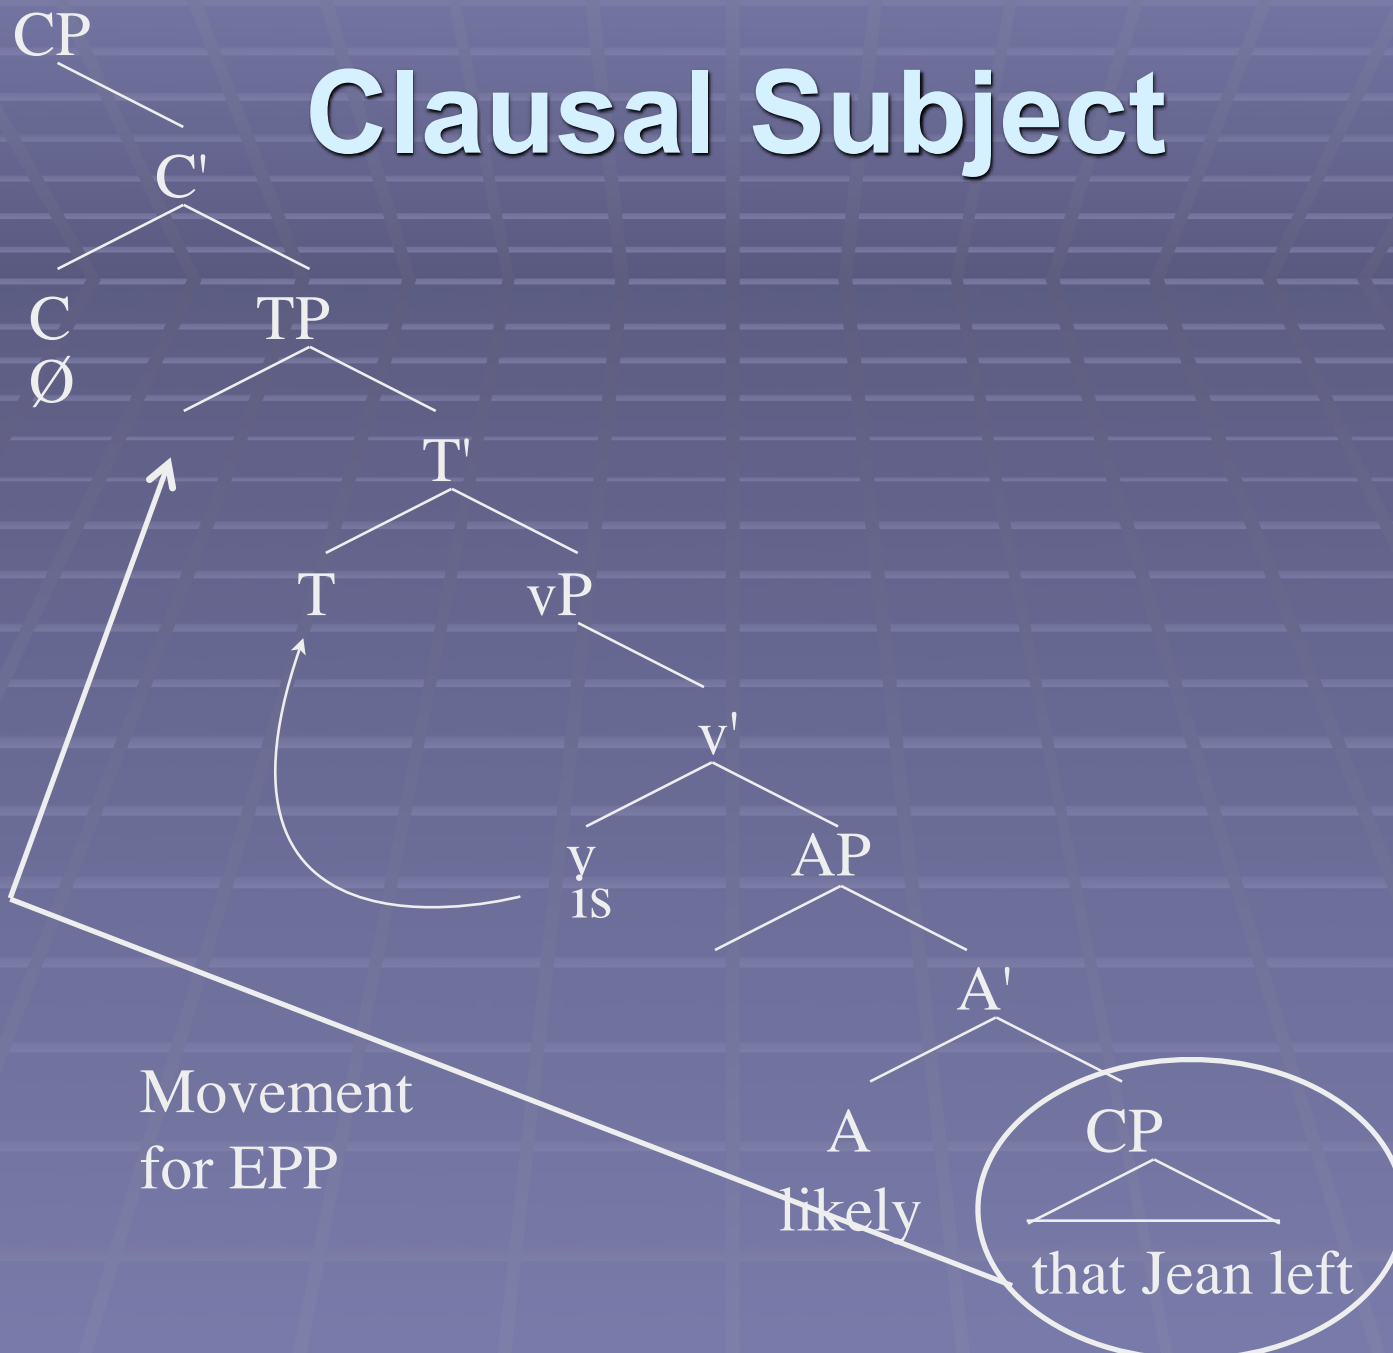

Raising Predicate

- *Is likely*
 - proposition
- *extraposition*
 - It is likely [that John will leave]_i
- *clausal subject*
 - [that John will leave]_i is likely.
- *subject to subject raising*
 - John_j is likely [t_j to leave]_i

Extraposition

Clausal Subject

Raising

NOM and EPP

EPP & MLC

Not a case
assigner: non-
finite

Raising vs. Control

- *Is likely*

- proposition

--

- *Is reluctant*

- Experiencer

Proposition

--	--

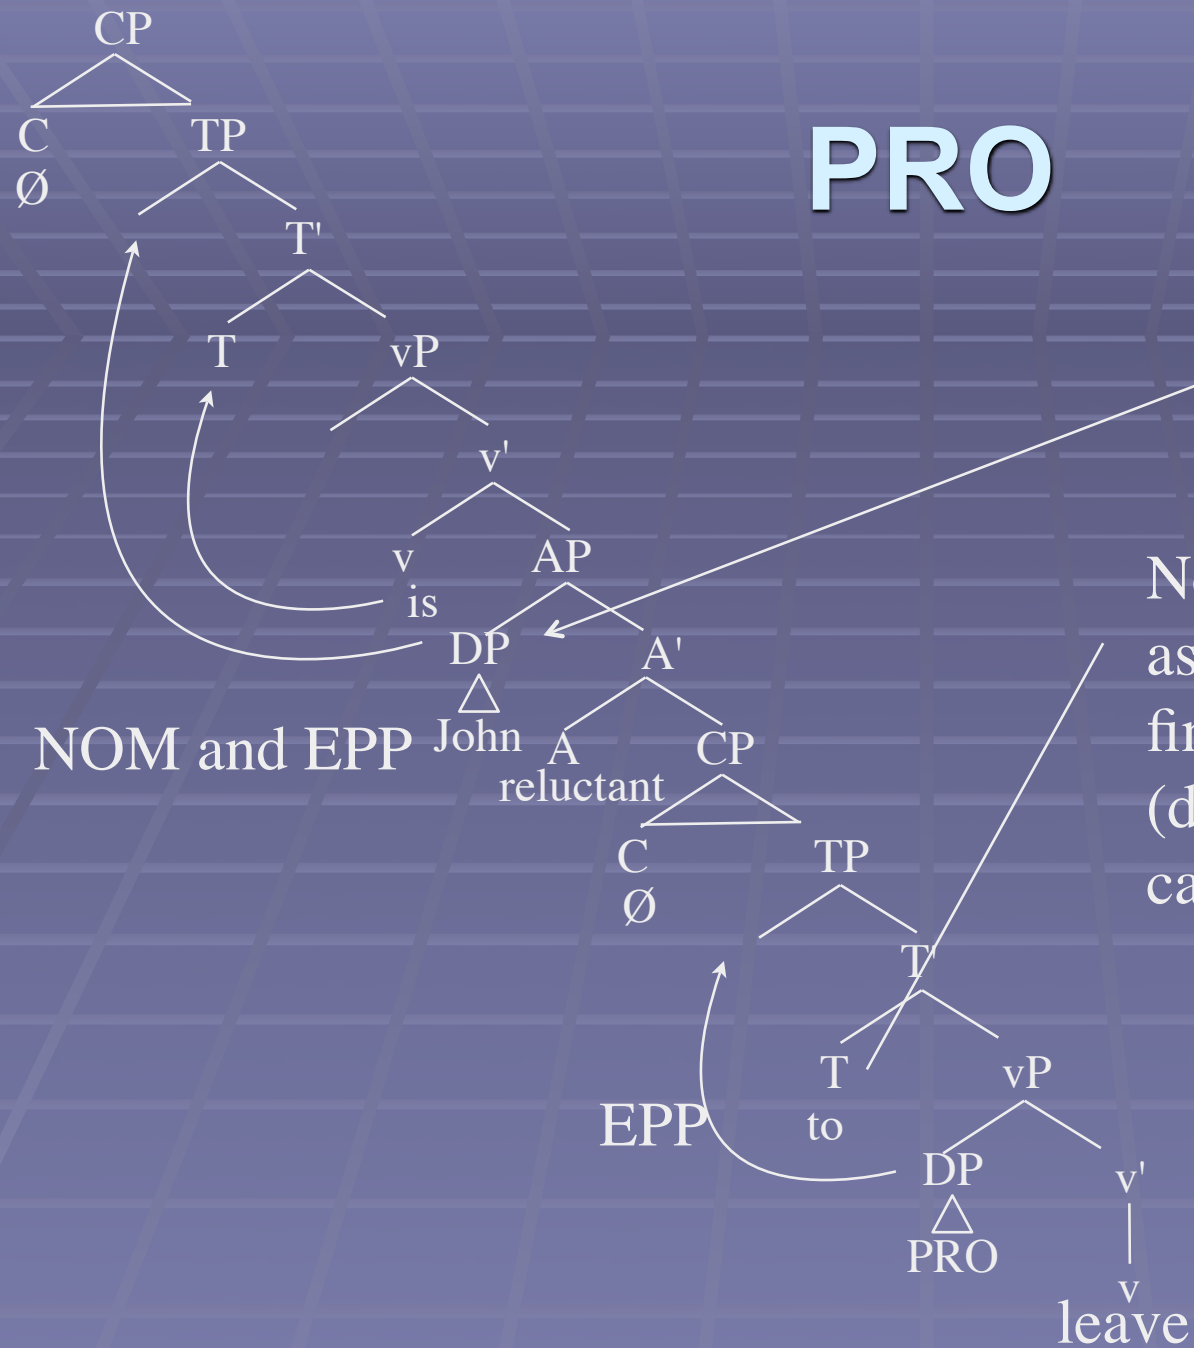

Distinguishing Raising from Control

1. Work out theta grids
2. Control disallows expletive subject:
 - § *It is reluctant [that John will leave].
3. Control disallows clausal subject:
 - § *[That John will leave] is reluctant.
4. Idiom test:
 - § The shit hit the fan
 - § The shit is likely to hit the fan (retains idiomatic meaning)
 - § #The shit is reluctant to hit the fan (loses idiomatic meaning)

Where's the missing subject?

- John is reluctant to leave
- Where is the agent of *leave*?
- John already gets theta role from *is reluctant*. So by the theta criterion it can't get one from *leave*.
- Solution: PRO
- PRO is a null, CASELESS subject. Notice that PRO is a DP in a position without case (explaining why it is null).

PRO

Gets experiencer
role from reluctant,
gets nom case from
T

Not a case
assigner: non-
finite, so PRO
(doesn't need
case)

NOM and EPP

EPP

Another Kind of Raising

- Subject to Subject raising
 - John is likely to leave
- Subject to Object Raising (ECM):
 - John wants Bill to leave
 - Bill wants him to leave
- In order to get accusative case on the subject of the embedded clause you have to raise the subject to be the sister of V.

Subject to Object

Object Position?

- Accusative Case:
 - I want him to leave
- Binding theory:
 - John_i wants himself_i to leave.
 - John_i wants him_j to leave.
 - *John_i wants him_i to leave.
 - (cf. John_i thinks that he_{i/j} should leave)

Another kind of control

- Subject Control:
 - Jean is reluctant PRO to leave
- Object Control:
 - Jean persuaded Robert PRO to leave
- Think about the theta grid for persuade:
 - | | | |
|--------------|-------|-------------|
| <u>Agent</u> | Theme | Proposition |
| | | |

Theta grids for object control

- Persuade:

- | <u>Agent</u> | Theme | Proposition |
|--------------|-------|-------------|
| i | j | m |

- Leave:

- | <u>Agent</u> |
|--------------|
| k |

Jean_i persuaded Robert_j [PRO_k to leave]_m

Distinguishing SOR from OC

- SOR
 - John wants the shit to hit the fan
- OC
 - #John persuaded the shit to hit the fan

Control Theory

Determining the meaning of PRO
Or the least well worked out area
of generative grammar.

Types of PRO

- Note, the indices here are the indices of binding theory, not the indices of theta grids.
- PRO_{arb} :
 - PRO to find a mate, go to a dating service
- Non-arbitrary PRO
 - $Jean_i$ tried PRO_i to behave.
 - *Obligatory Control*:
 - $Jean_i$ tried $PRO_{i/*j}$ to behave
 - *Non-Obligatory Control*
 - $Robert_j$ knows that it is essential [$PRO_{i/j}$ to be well behaved]

Is PRO an R-expression, Pronoun or Anaphor?

- Well it can be bound, so it isn't an R-expression.
- It isn't bound within its clause, so it isn't an anaphor.
- Could it be a pronoun?
 - Robert_i knows it is essential PRO_{i/j} to be well behaved
 - Robert_i knows it is essential that he_{i/j} is well behaved.
- Problem: sometimes it is obligatorily bound, like an anaphor:
 - Jean_i tried PRO_{i/*j} to behave.
- Solution: It is neither a pronoun nor an anaphor. It does not fall within the domain of binding theory. So how do we deal with it?

Control

- Conclusion 1:
 - The controller (loosely the antecedent) must c-command PRO:
 - [Jean_i's father]_k is reluctant PRO_{k/*i} to leave.

Control

- Observation:
 - In some sentences, the controller is the NP closest to the PRO
 - Jean_i persuaded Robert_k PRO_{k/*i} to leave.
 - But in others it is not:
 - Jean_i promised Susan_k PRO_{i/*k} to leave.
- These sentences are identical in structure, and differ only in the verb. So the difference in controller might be specified in the lexicon.

Control as part of the lexicon

- Persuade:

- | | | |
|--------------|-------------------|-------------|
| <u>Agent</u> | Theme | Proposition |
| | <i>controller</i> | |
| | | |

- Promise:

- | | | |
|-------------------|-------|-------------|
| <u>Agent</u> | Theme | Proposition |
| <i>controller</i> | | |
| | | |

But that can't be right either:

- Louis_i begged Kate_k [PRO_k to leave her job]
- Louis_i begged Kate_k [PRO_i to be allowed to quit his job]
- ACK! Here it is the embedded clause, not the main clause that is determining who the controller is...
 - Perhaps Control isn't syntactic, but pragmatic (comes from real world knowledge).
 - Or perhaps we just haven't figured it out yet!

PRO vs. *pro*

- PRO is the caseless form found in infinitivals in English.
- *pro* is the null subject found in CASED positions in languages like Spanish and Italian:
 - *pro* parlo “I speak”
 - *pro* parli “you speak”
- In many languages *pro* is licensed by rich agreement morphology.
- Null subject parameter:
 - Language allows null subject pronouns. Yes or No.
 - English, French: NO
 - Spanish, Italian, Irish: YES

Summary

- Distinguished SSR from SC
 - Expletive insertion
 - Clausal Subject
 - Idiom test
- Distinguished SOR from OC
 - Idiom test
- Difference lies in the number of theta roles.
- Discussed the structural, lexical and pragmatic factors underlying Control.
- Distinguished PRO from *pro*.
